Adobe Commerce connection: data flow and security controls

Tapper Vantage · A read-only connection between an Adobe Commerce (Magento 2.4) store and Tapper · October 2026

CONTROLS

Read only

The integration has view permissions only, and every request Tapper makes is a GET. Nothing in the store can be created, changed, refunded or cancelled.

Access and revocation

In Tapper, only a workspace Owner or Admin can connect or change the store, with two-step sign-in where the account has it. The store revokes access at any time by deleting or reauthorizing the integration.

Personal data

The email is hashed on arrival and the raw address is never stored. Names, addresses, phones, IP addresses and payment details are never requested.

Storage and keys

Hosted in Google Cloud, europe-west1. Integration keys are sealed with Cloud KMS and never shown again. Disconnecting deletes them. A customer's or the whole store's data is deleted on request.

1 The tag reports the purchase. **2** Tapper reads changed orders through the integration. **3** The email is hashed on arrival. **4** The analytics copy leaves out the hashes. **5** Order values go to the client's ad accounts.
